

Case Study: How do we map the seafloor?

Examining Regional Environmental Characterisation Surveys (RECs)

Lesson

This case study provides a real-life example of physics in the workplace. It examines marine archaeological research, focusing on how scientists mapped the physical properties of the seafloor at KS3 and KS4.

Using this lesson

Check out our website <http://ets.wessexarch.co.uk/teachers/physics> for the accompanying teacher pack and resources.

The colour-coded boxes indicate downloadable activities, discussion ideas and opportunities and links to find out more.

Details are provided in the teacher pack.

What is an REC?

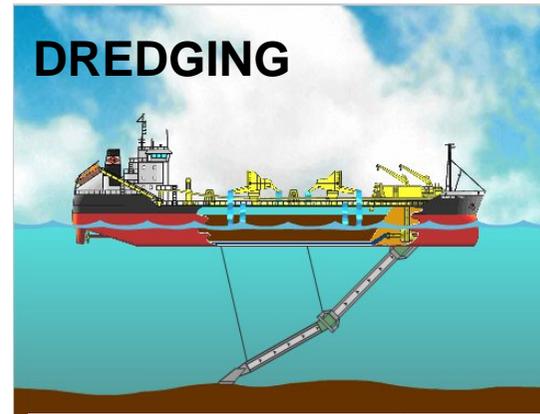

A scientific multidisciplinary marine study of the **geology**, **biology** and **archaeology** of different areas of the British coast.

Main Objective

To provide integrated maps of the seafloor, to allow the sustainable management of offshore resources now and in the future.

Funded

Marine Aggregate Levy
Sustainability Fund (MALSF)

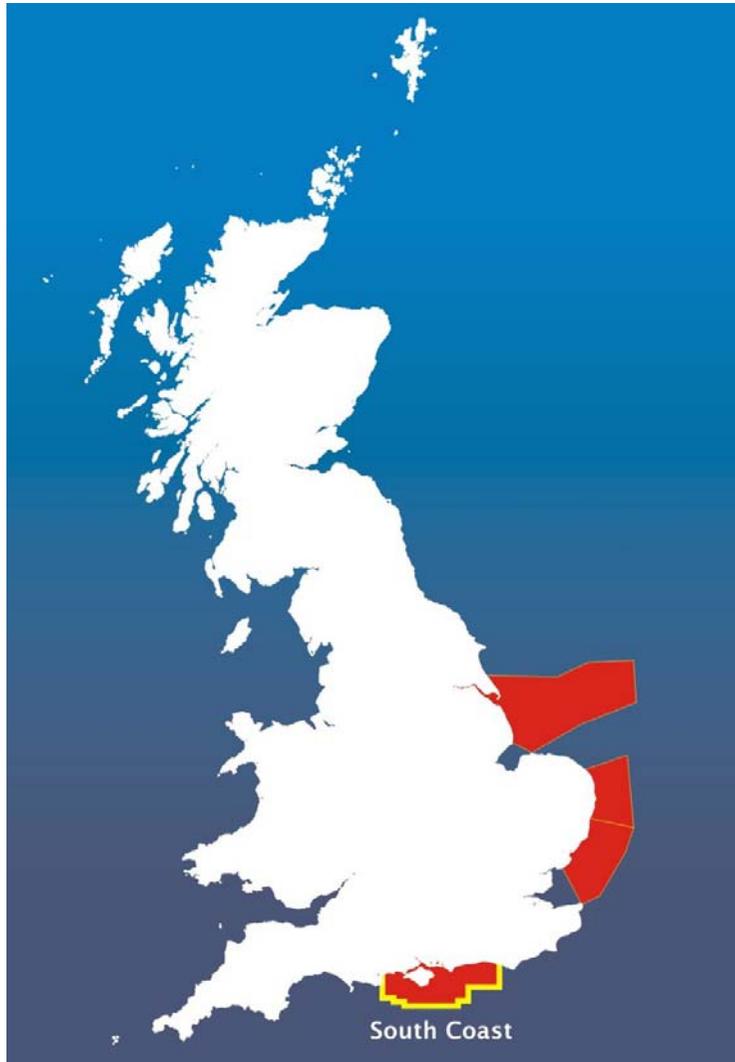

Be a
Seafloor
Explorer

South Coast REC survey

This lesson focuses on the scientific techniques that the archaeologists, ecologists and geologists used during the South Coast REC research.

Study Aims

- To create maps showing the morphology and sediment distribution of the seafloor (**geology**).
- To create maps showing the location of archaeological material, including prehistoric material and ship or aircraft wrecks (**archaeology**)
- To create integrated maps of sea animals communities and their physical habitats (**ecology**)

Size of study area: 5600km²

Date: 2008 - 2010

**Background
information**

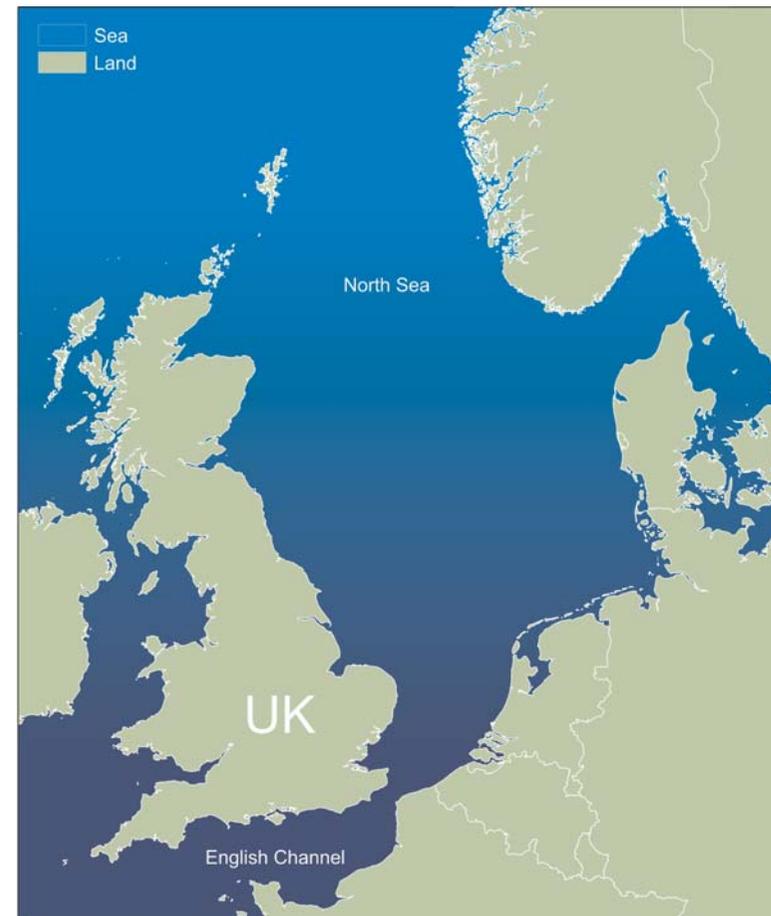

Mapping the Seafloor

REC Methodology

For each of the three subject areas, there are three main stages to the research of the South Coast REC.

| | | |
|---------|--------------------------|--|
| Stage 1 | Collecting Data | <ul style="list-style-type: none">• Fieldwork• Desk based assessment. |
| Stage 2 | Results – using the data | <ul style="list-style-type: none">• Creating maps• Final report |
| Stage 3 | Recommendations | Highlighting what is special about the South Coast REC study area |

Stage 1: Collecting data

Issues for researching REC study

- Covers a large area
- Looking to get a general picture of what is there
- Limited by time and money

What the scientist's did

- Fieldwork:
 - Geophysical survey
 - Vibrocorer
 - Grab Samples
 - Underwater photography
- Desk Based Assessment

Collecting samples

[Marine Careers](#)

Fieldwork: Geophysical Survey

Geophysical survey collects information about the physical properties of the seafloor and create images. Archaeologists used several techniques

Sonar

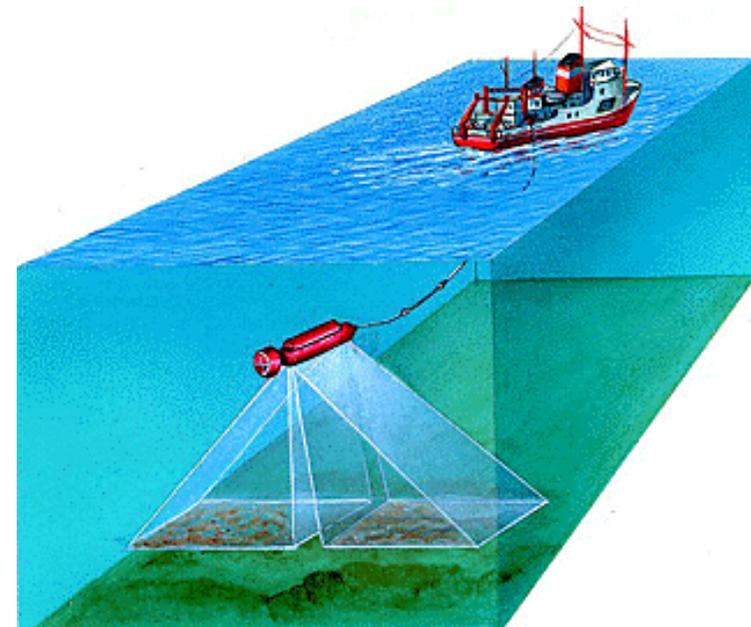

Uses sound waves to record the seafloor

Archaeologists used several different acoustic survey methods

- Sidescan Sonar
- Bathymetry Multibeam Sonar
- Sub-Bottom Profiler

Magnetometry

Measures magnetic changes, which is good for detecting iron (e.g. shipwrecks)

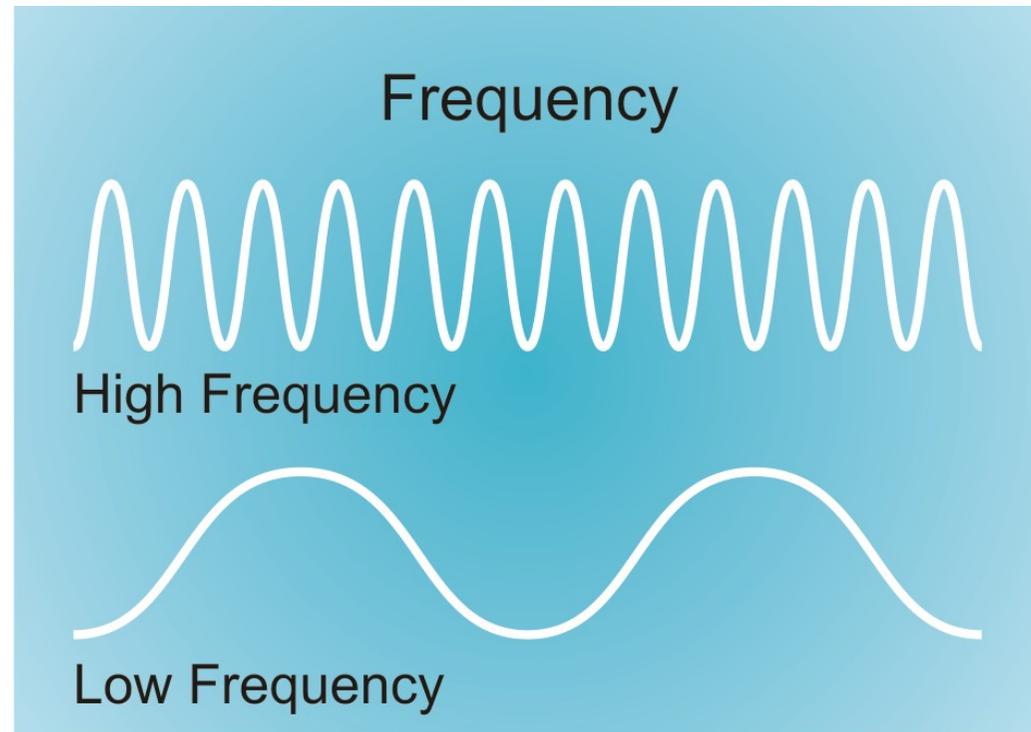

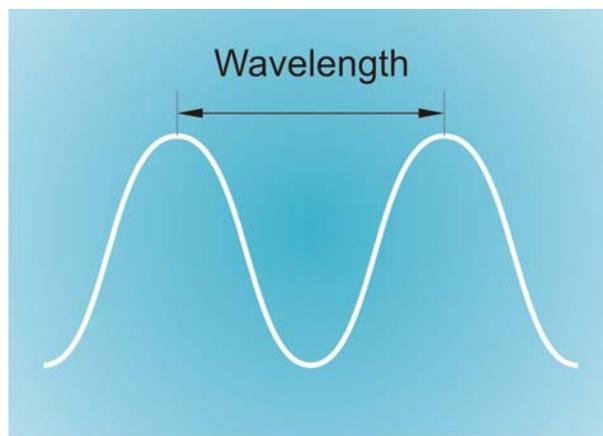

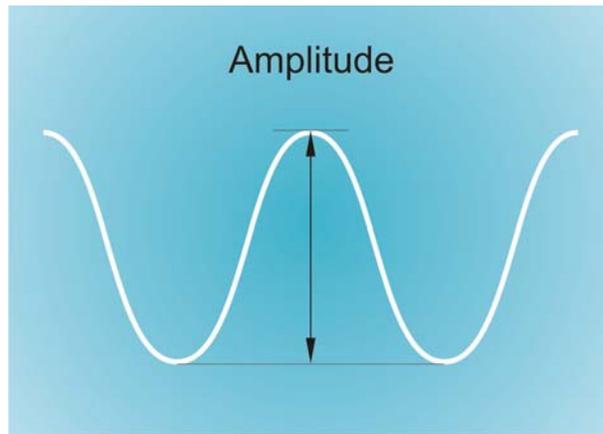

Geophysics

Acoustic geophysical techniques: the principles

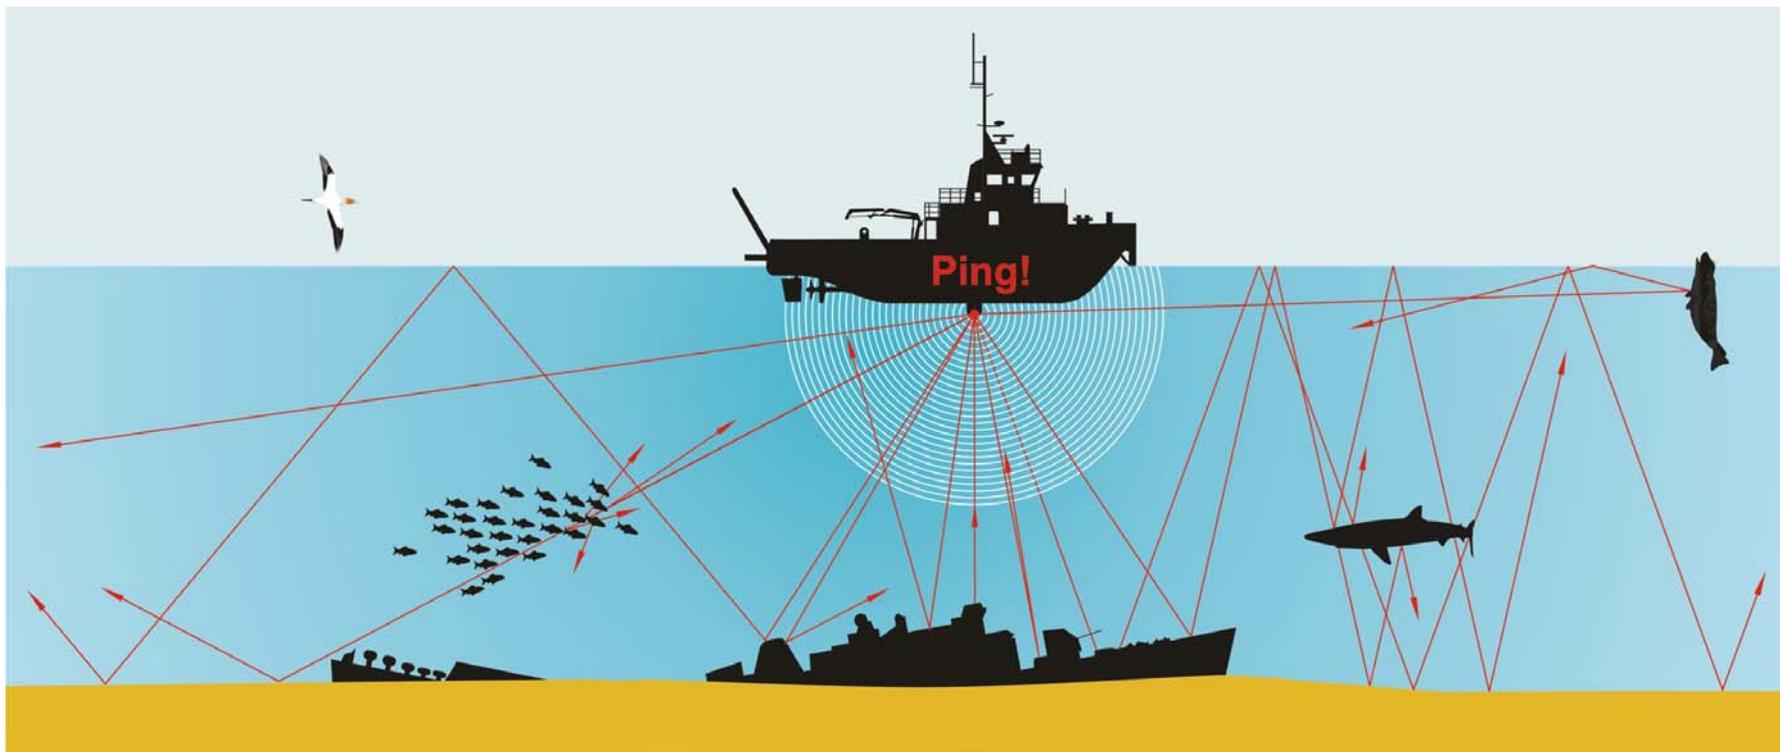

Using soundwaves

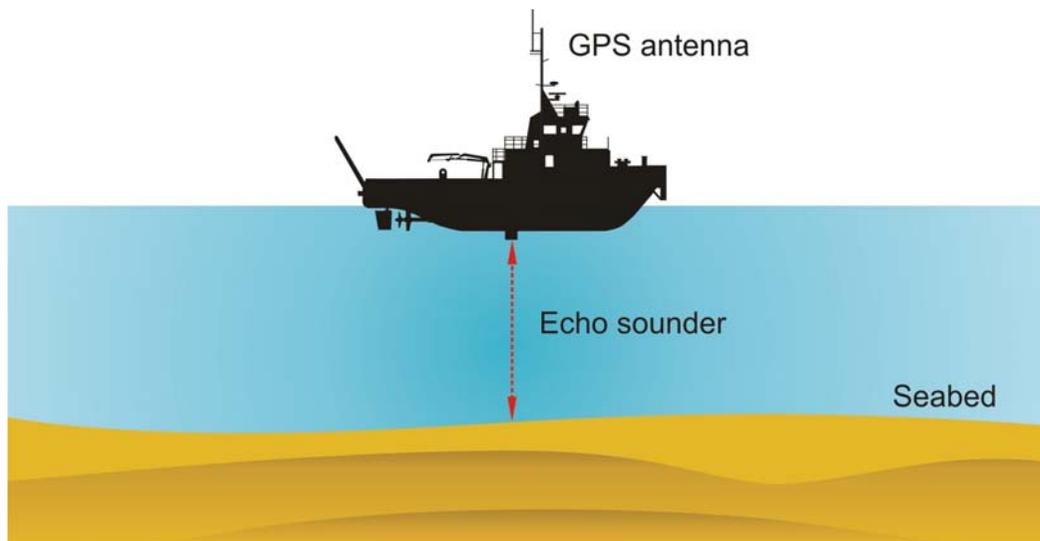

Sound waves underwater

The basics: echo sounders

Speed of sound in water
= 1,560 metres per second

Time it took the sound wave to
leave and return = 0.05 sec

Speed = distance/time
 $1560 = d / 0.05$

$$\frac{(1560 \times 0.05)}{2} = 39$$

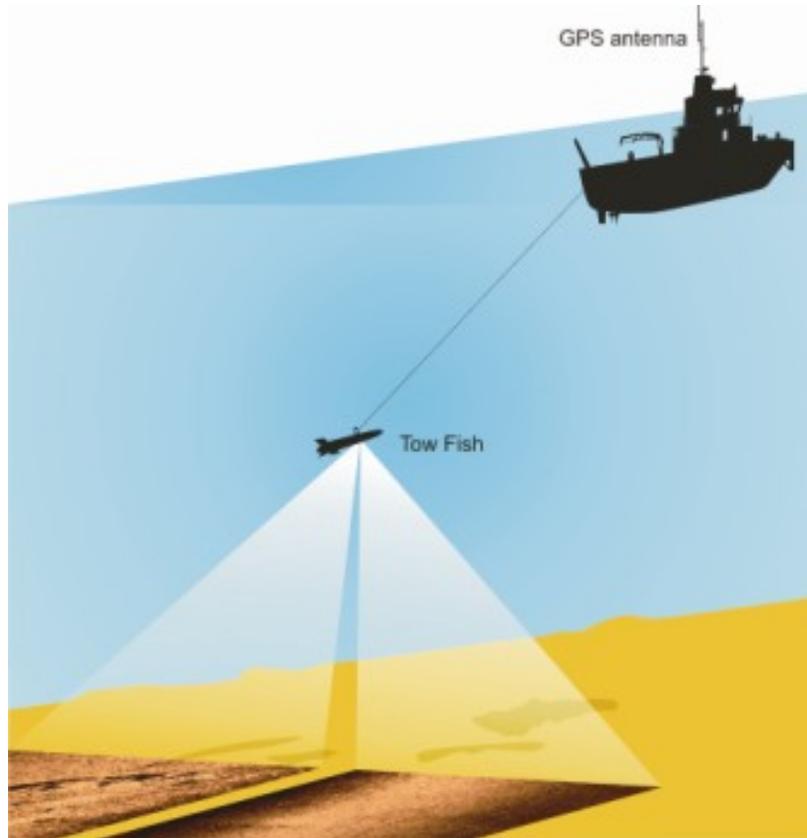

The seafloor is **39m** deep.

Why do we divide the equation by two?

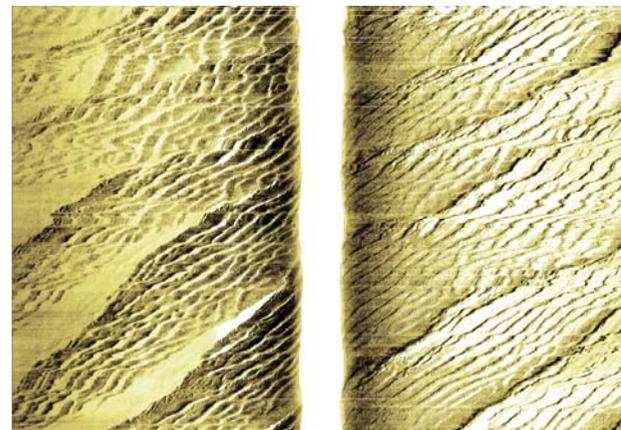

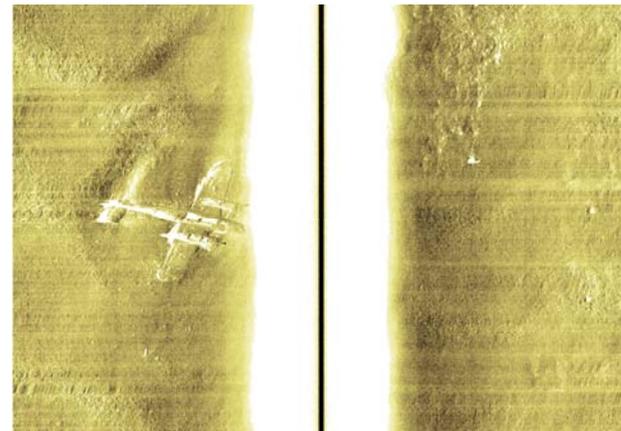

Sidescan Sonar

Aircraft wreck: Dornier

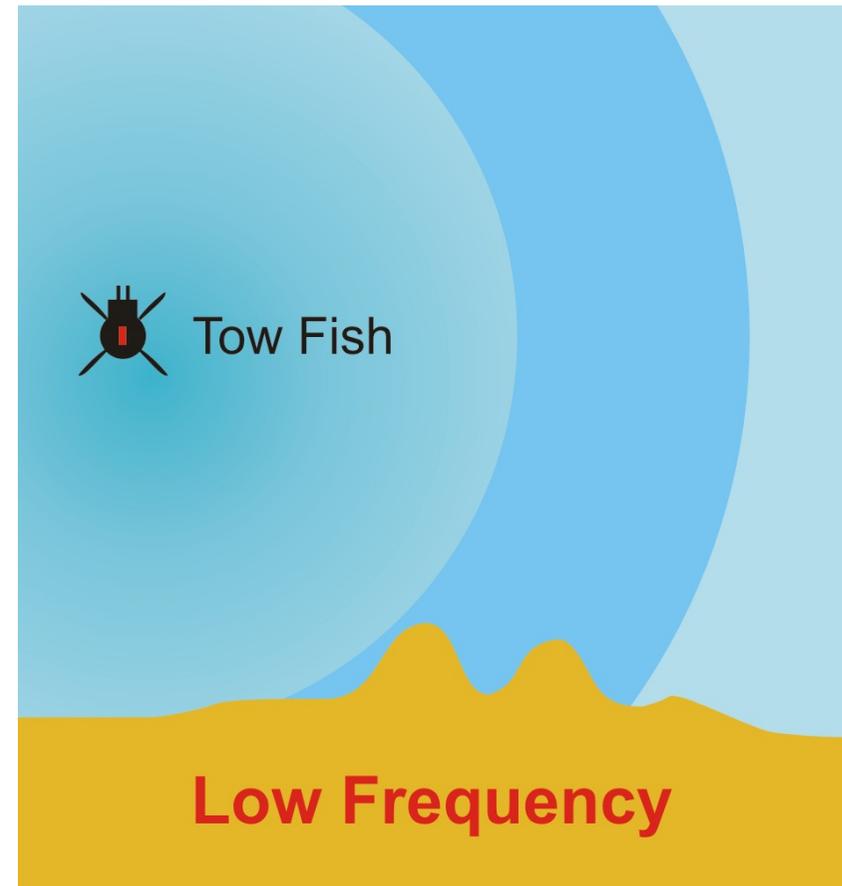

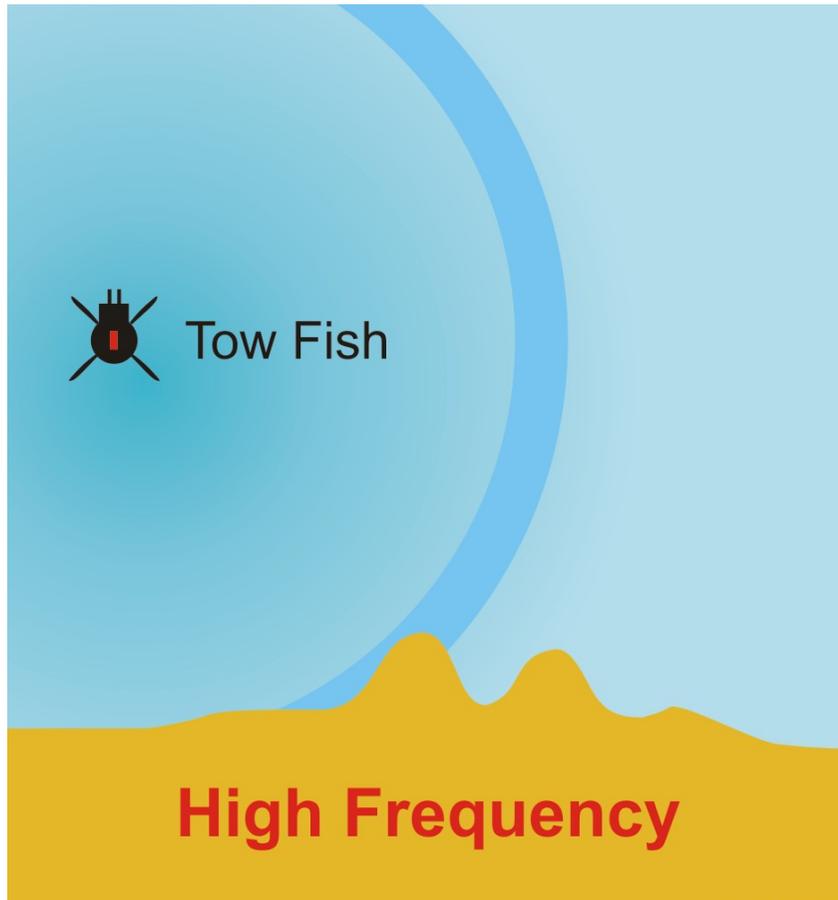

Why is there a white line down the middle of the images on the right?

Sand ripples on the seafloor

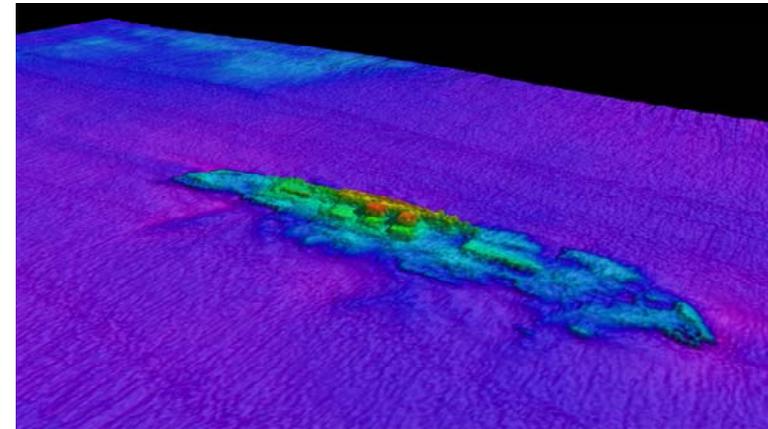

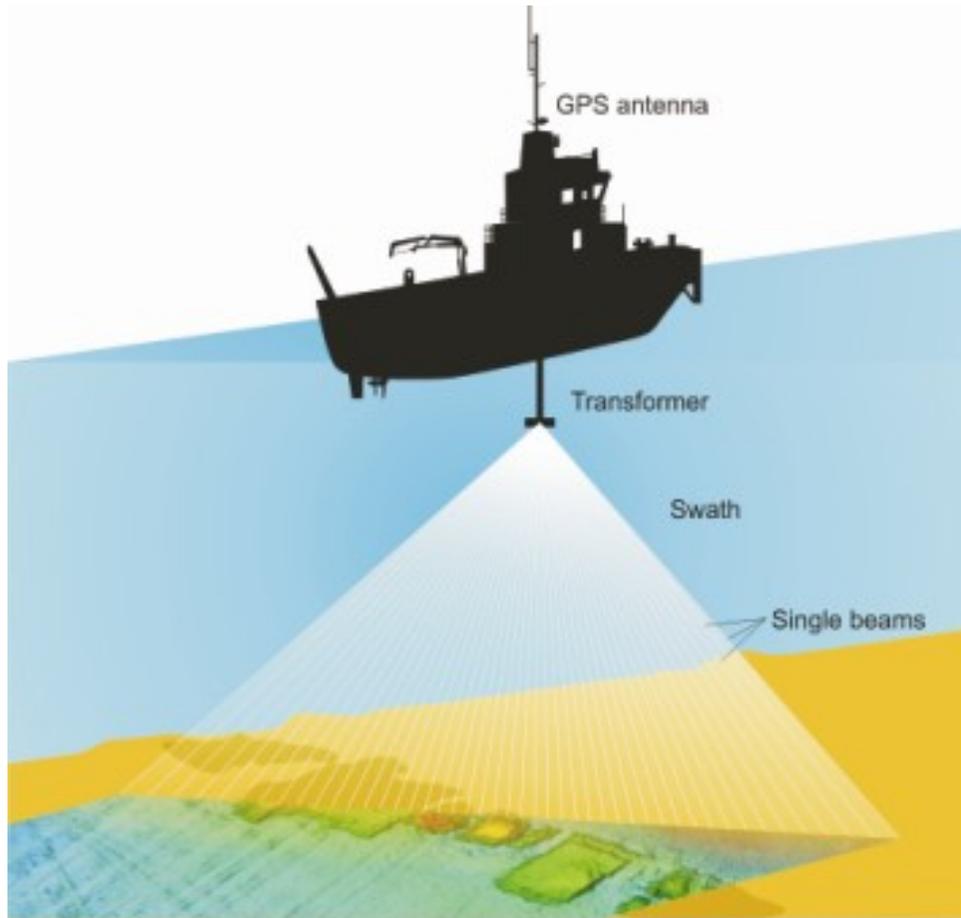

Frequency/Resolution

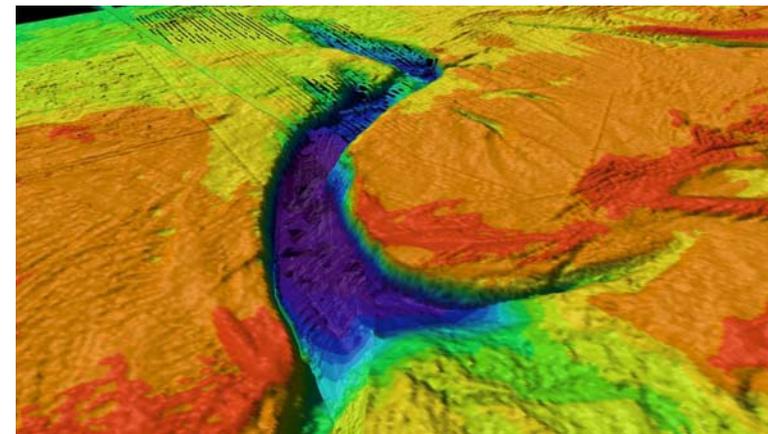

Multibeam sonar

SS Mendi: World War I shipwreck

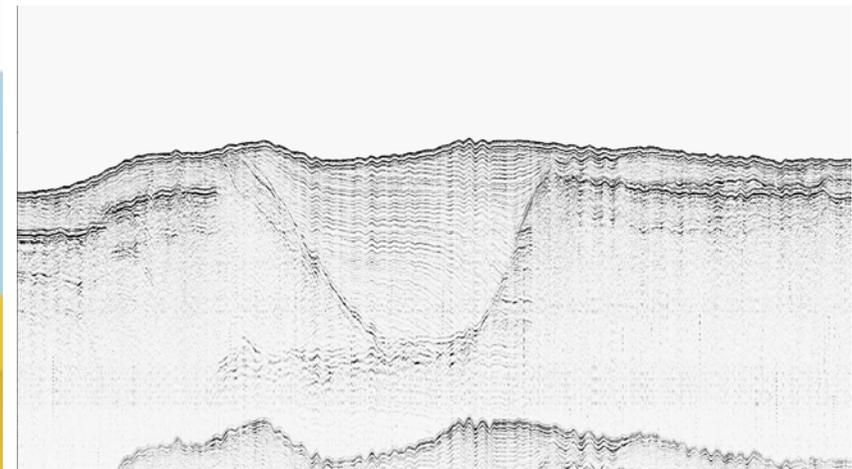

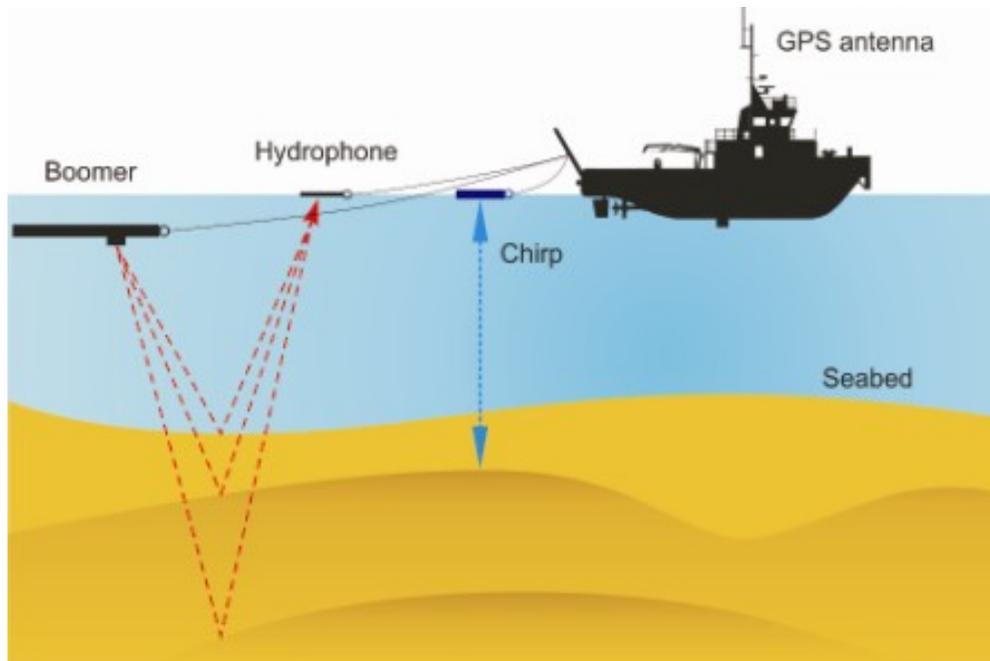

A tunnel valley on the seafloor

Sub-bottom profiling

An ancient river channel filled in with buried sediments – can you see it?

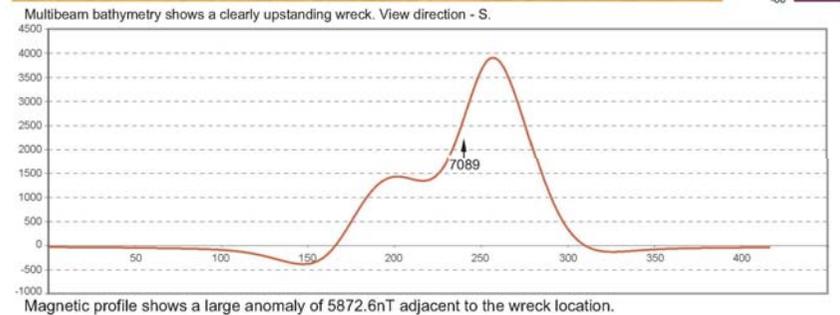

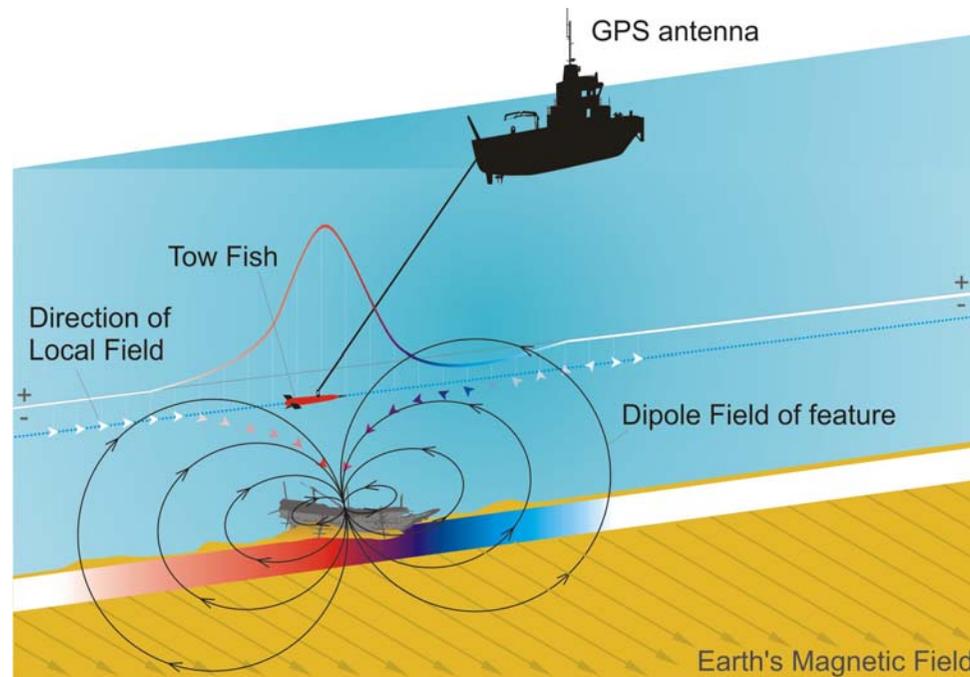

Frequency: noisy neighbours

Using
sound
waves

Magnetometry

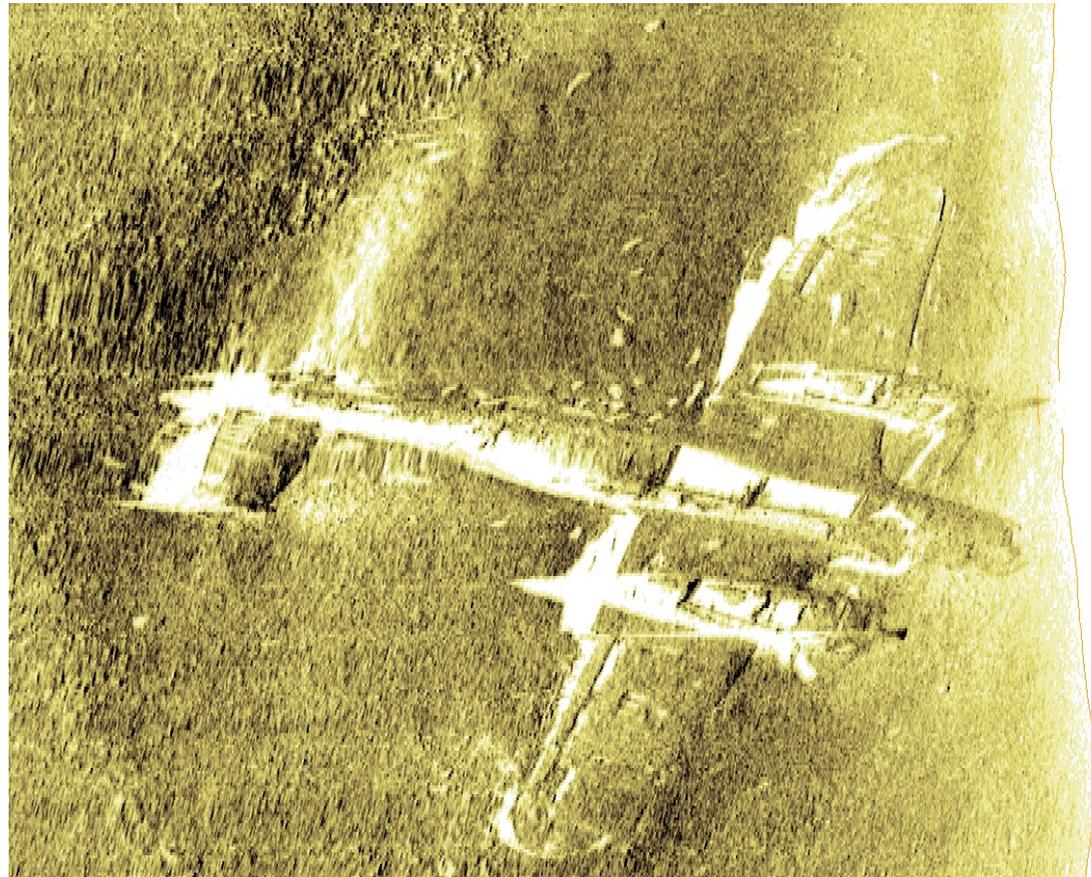

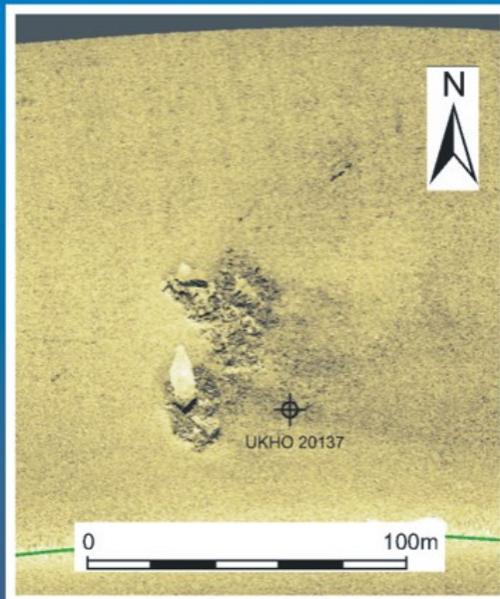

SS Mendi: World War I
shipwreck

Results vary

This anomaly shows the remains of the ship called the HMT *Inverclyde*. It takes expertise to be able to tell if an anomaly is a ship or aircraft wreck rather than a geological feature, like rocks, on the seafloor.

Interpreting Geophysics (2)

Covering the study area

What do the lines on the map represent? Do they provide a representative coverage of the study area?

- South Coast REC Study Area
- Physical Region Boundary
- South Coast REC 2007 Survey geophysical lines
 - Boomer sub-bottom profiler
 - Multibeam, sidescan sonar and magnetometer

How do we study the seafloor?

Desk Based Assessment

What is a DBA?

A DBA collects together and **summarises in a report** any relevant research already undertaken and other sources of information about the archaeology, ecology and geology for the study area, parts of the study area or areas in the study area's vicinity.

Sources of information:

- Historical and previous archaeological work research
- Past geophysical survey data
- Research on sea animals, birds and fishing industry

Sources of information

Archives, like the National Monument Records, hold a variety of material that can help archaeologists understand the past, including old maps, letters and archaeological records. Historical images are important sources of information. They can show us what ships looked like when they were in use.

Stage 2: Results

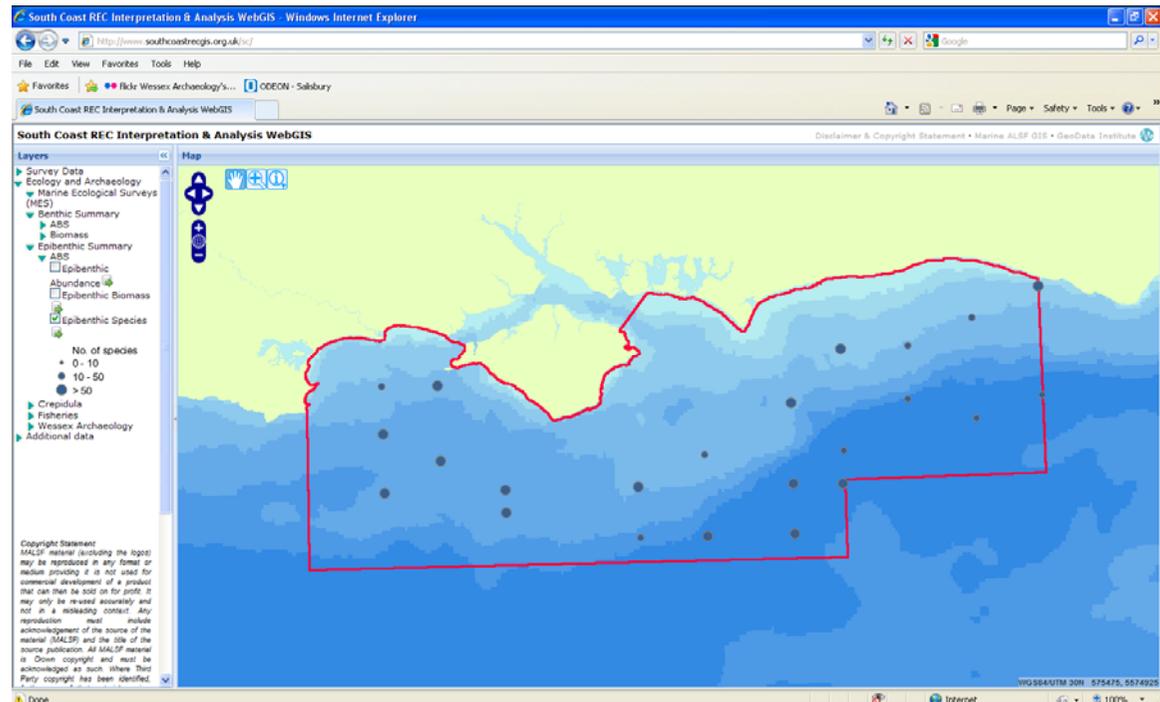

The final report covered:

- **Geology**
- **Archaeology**
- **Ecology**

To create these maps the archaeologists used GIS

GIS stands for Geographic Information System

Modelling data – this helped fill in the gaps

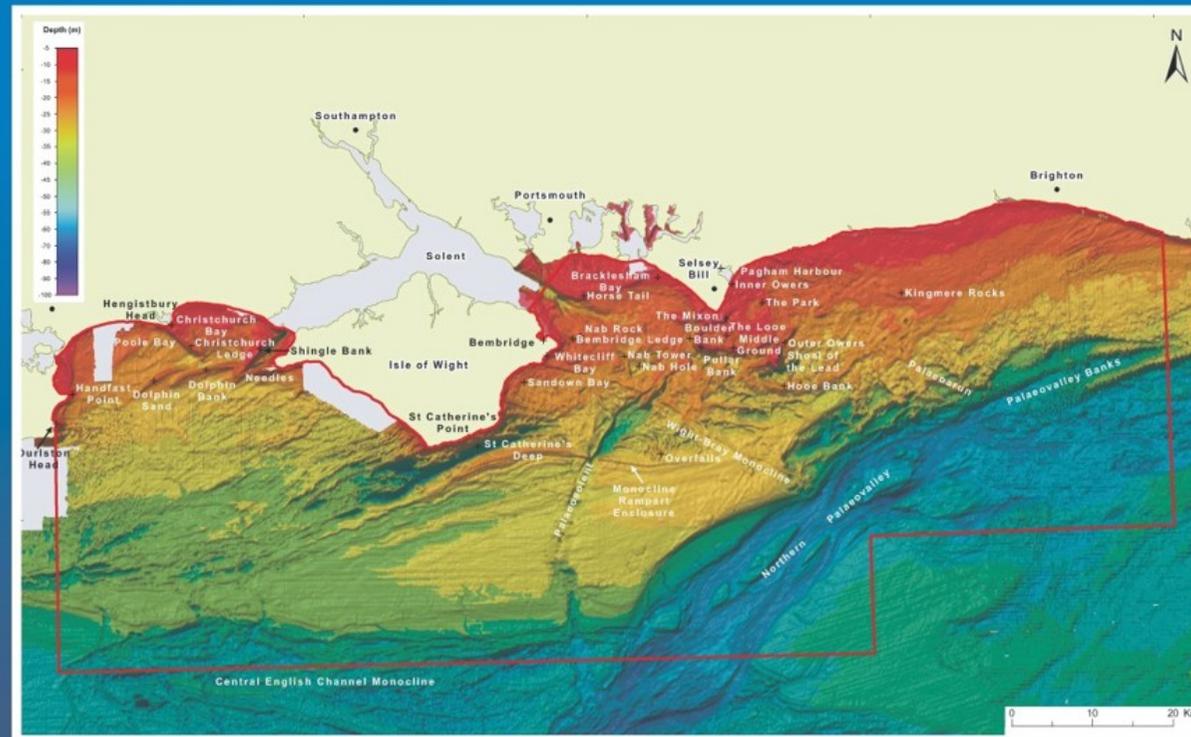

Website: [South Coast REC GIS](http://www.southcoastrecgis.org.uk/)

What does the seafloor look like?

Geologists used geophysical survey bathymetry data to create this map of the South Coast seafloor.

Digital bathymetry data © British Crown & SeaZone Solutions Ltd. Licence No. 052008.012. All rights reserved.

Fly through: 3-D of the South Coast REC morphology

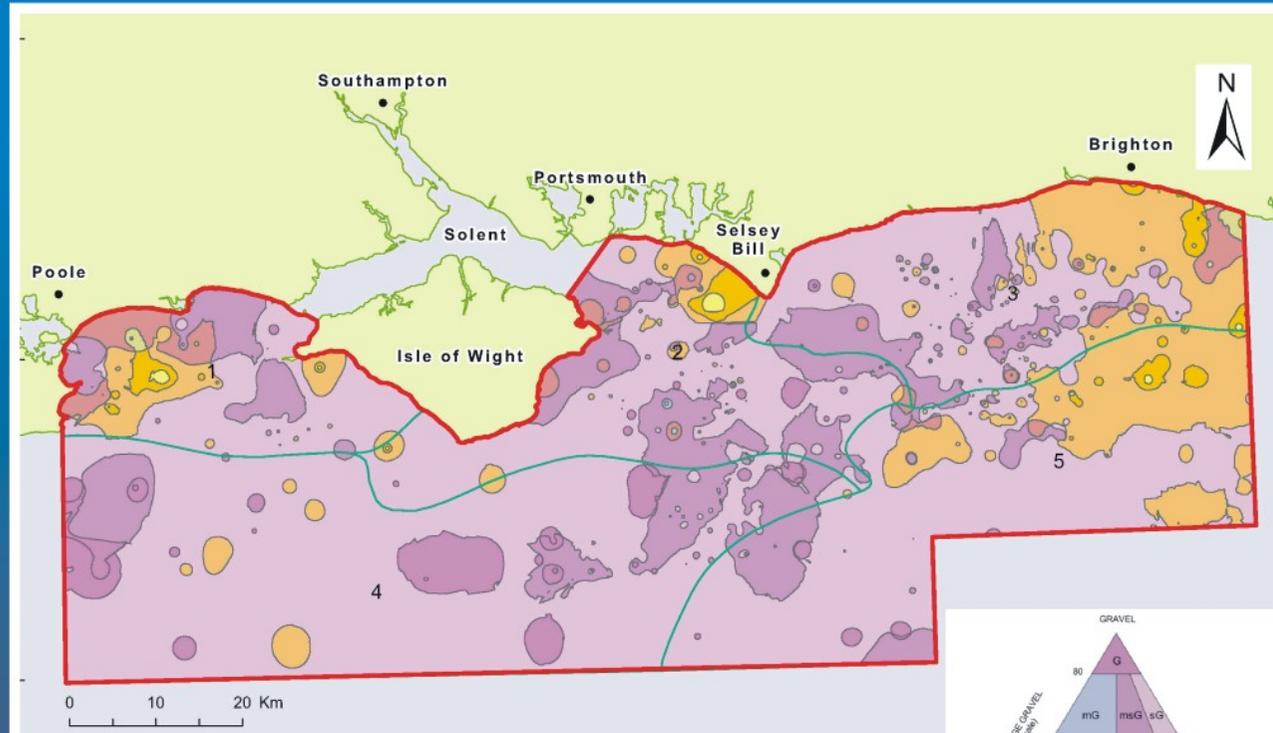

What is the seafloor made of?

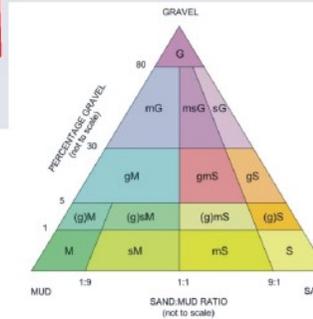

Can you use the legend to work out what the majority of the South Coast seafloor is made of?

What is the seafloor made of?

A distribution map of seafloor sediment shows this.

| | | | |
|-------|-----------------------------|-------|------------------------------|
| M | Mud | (g)mS | Slightly gravelly muddy sand |
| sM | Sandy mud | gmS | Gravelly muddy sand |
| (g)M | Slightly gravelly mud | gS | Gravelly sand |
| (g)sM | Slightly gravelly sandy mud | G | Gravel |
| gM | Gravelly mud | mG | Muddy gravel |
| S | Sand | msG | Muddy sandy gravel |
| mS | Muddy sand | sG | Sandy gravel |
| (g)S | Slightly gravelly sand | | |

The above classification is based on that of R.L. Folk, 1954, J. Geol., 62 pp344-356.

World War II geophysics results

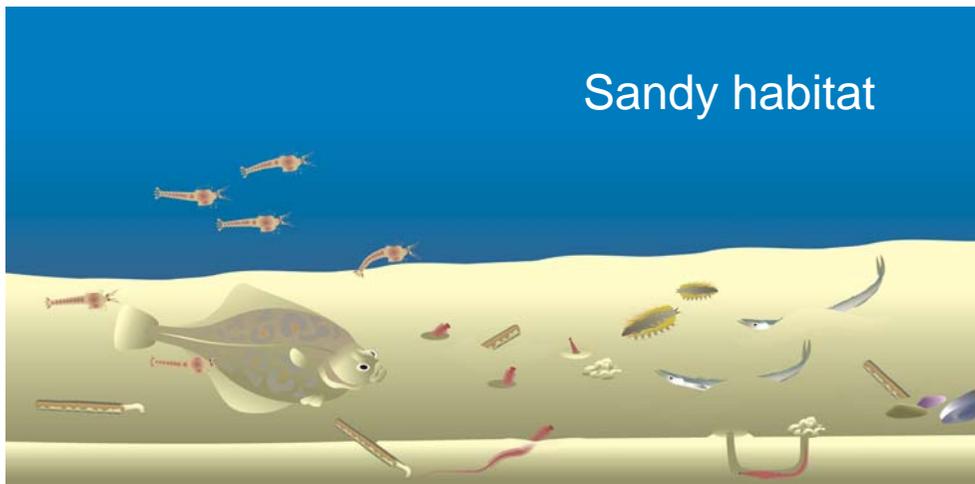

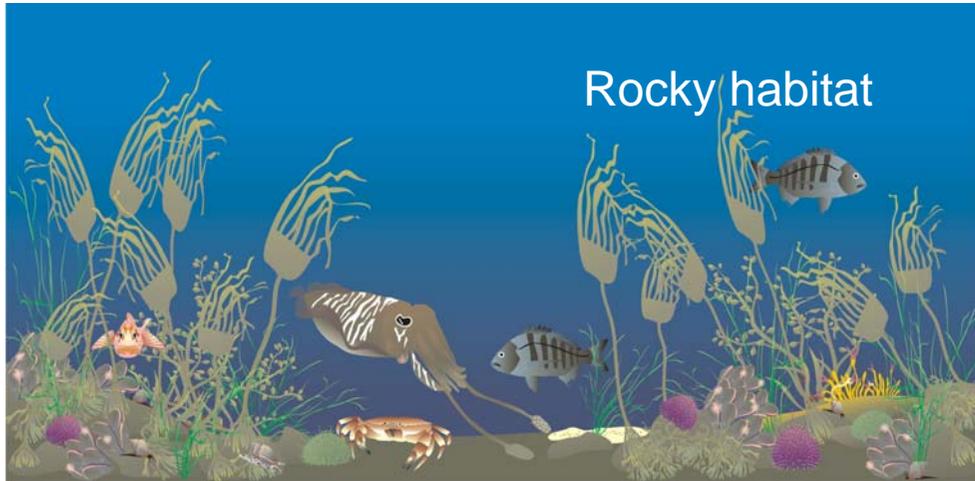

How useful is geophysical survey for finding WWII shipwrecks? Why?

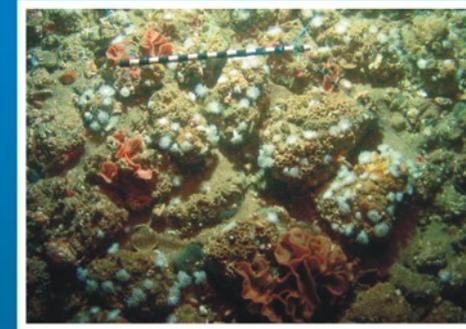

Habitats

South Coast Reefs:

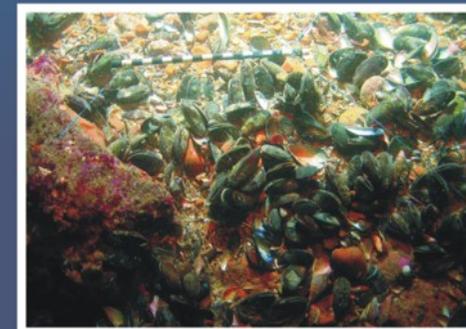

What are they?

This can be either rocky marine habitats or biogenic reefs, those created by sea animals.

Why are they important?

- Biodiversity hotspots with lots of different types of sea animals living there.
- They both provide shelter and a solid foundation for animals to cling on to.
- There are lots of nooks and crannies for sea animals to live in.

Discussion

- So how do we map the seafloor?
- Discuss some of the advantages and disadvantages of using these methods to collect information about the physical properties of the seafloor
 - Geophysical survey
 - Desk based assessment
 - Grab samples
- How can frequency affect the following acoustic survey techniques
 - Sidescan sonar
 - Multibeam bathymetry
 - Sub-bottom profiler
- Discuss why scientists mapped the seafloor?
- Do you think it is important that we protect our seafloor? Why?
